PROJECT: GENERATING KEYWORDS FOR SEARCH CAMPAIGNS

datalab

Imagine working for a digital marketing agency, and the agency is approached by a massive online furniture retailer. They want to test your skills at creating large campaigns for all of their website. You are tasked with creating a prototype set of keywords for search campaigns for their sofas section. The client says that they want you to generate keywords for the following products:

- sofas
- convertible sofas
- love seats
- recliners
- sofa beds

The client is a low-cost retailer, offering many promotions and discounts. You will need to focus on such keywords. You will also need to move away from luxury keywords and topics, as you are targeting price-sensitive customers. Because they are going to be tight on budget, it would be good to focus on a tightly targeted set of keywords and make sure they are all set to exact and phrase match.

Based on the brief above you will first need to generate a list of words, that together with the products given above would make for good keywords. Here are some examples:

- Products: sofas, recliners
- Words: buy, prices

The resulting keywords: 'buy sofas', 'sofas buy', 'buy recliners', 'recliners buy', 'prices sofas', 'sofas prices', 'prices recliners', 'recliners prices'.

As a final result, you want to have a DataFrame that looks like this:

Campaign	Ad Group	Keyword	Criterion Type
Campaign1	AdGroup_1	keyword 1a	Exact
Campaign1	AdGroup_1	keyword 1b	Exact
Campaign1	AdGroup_2	keyword 2a	Exact

```python
# Start coding here
# Use as many cells as you need
import pandas as pd
# List of words to pair with products
words = ['buy', 'price', 'discount', 'promotion', 'promo', 'shop']

# Print list of words
print(words)

products = ['sofas', 'convertible sofas', 'love seats', 'recliners', 'sofa beds']

# Create an empty list
keywords_list = []

# Loop through products
for product in products:
    # Loop through words
    for word in words:
        # Append combinations
        keywords_list.append([product, product + ' ' + word])
        keywords_list.append([product, word + ' ' + product])

# Inspect keyword list
print(keywords_list)

# Create a DataFrame from list
keywords_df = pd.DataFrame(keywords_list, columns=['Ad Group', 'Keyword'])

# Print the keywords DataFrame to explore it
print(keywords_df)

# Add a campaign column
keywords_df['Campaign'] = 'SEM_Sofas'

# Add a criterion type column
keywords_df['Criterion Type'] = 'Exact'

# Save the final keywords to a CSV file
keywords_df.to_csv('keywords.csv', index=False)
```

```
20  convertible sofas      convertible sofas promo
21  convertible sofas      promo convertible sofas
22  convertible sofas       convertible sofas shop
23  convertible sofas       shop convertible sofas
24         love seats               love seats buy
25         love seats               buy love seats
26         love seats             love seats price
27         love seats             price love seats
28         love seats          love seats discount
29         love seats          discount love seats
30         love seats         love seats promotion
31         love seats         promotion love seats
32         love seats             love seats promo
33         love seats             promo love seats
34         love seats              love seats shop
35         love seats              shop love seats
36          recliners               recliners buy
37          recliners               buy recliners
38          recliners              recliners price
39          recliners              price recliners
40          recliners           recliners discount
41          recliners           discount recliners
42          recliners          recliners promotion
